Introduction

Electric drives in industrial applications consume up to 70% of the total energy required. For many companies, this offers great potential for optimisation.

NORD DRIVESYSTEMS supplies a wide range of electric motors, which exceed very much common global efficiency regulations and standards.

Our motors are used in many applications because they are not just powerful and robust, but can also be combined with all NORD gear units.

With high gear ratios and direct motor mounting, toothed motor shafts are used, which enable a compact design.

Whether in agitators, conveyor systems, intralogistics or the food industry:

NORD electric motors can be found wherever high performance is required. They operate reliably over many years with very high efficiency.

This saves operating costs for our customers and at the same time helps protect the environment.

Catalogue G2122 contains information about gear units, motors and inverters for use in gas and dust explosion protection (ATEX).

Certificates and declarations of conformity can be found on our homepage under www.NORD.com.

Electro~Motor.ir

Asynchronous low voltage motors

The motors listed in this catalogue are asynchronous low voltage motors which can be used as geared motors or stand-alone motors.

The catalogue only includes motors from our own production in the power range from 0.12 to 55 kW. Information about motors with powers > 55 kW and special motors such as submersible motors or pot motors is available on request.

Information about Ex motors can be found in Catalogue G2122.

NORD IE1/Standard motors

Motors with efficiency class IE1 are still available from NORD. Their use must be checked with regard to national regulations.

Special ambient conditions or operating mode result in exceptional circumstances which legitimises the use of these motors.

Usually, IE1 motors in S1 mode are permissible for export to countries which prescribe IE1/IE2 and countries in which there are no corresponding regulations.

IEC60034-30 50Hz	60HZ (USA, ...)
IE1	NEMA Standard Efficiency
IE2	Equivalent to NEMA High Efficiency
IE3	Equivalent to NEMA Premium Efficiency
IE4	Equivalent to NEMA Super Premium Efficiency

Efficiency classes IE1, IE2, IE3, IE4

The standard IEC 60034-30:2008 specifies efficiency classes and therefore forms the basis for the various national efficiency requirements. In parallel with this, the standard IEC 60034-2-1:2007 harmonises the methods for measuring efficiencies.

Worldwide, requirements regarding motor energy efficiency are to be observed.

The motor selection is influenced by further development of motors and by ever more efficient technology as well as current and future national requirements in the country the drive is to be used.

NORD provides informatiob on this under:

www.nord.com / Products / Energy Efficiency Drives / National Regulations.

Introduction

IE2/IE3 - Technical differences

Motors with efficiency class IE3 differ considerably from the previously common IE1 motors.

Increased efficiency is achieved by using additional high quality materials as well as new production methods and design solutions. These definitely comply exceed the statutory requirements.

The change from previous motors to IE3 motors is facilitated by the (usually) same external dimensions of the NORD motor series. The previous motor dimensions are only insufficient in a few cases.

The tables in and beyond ⇒ [D2-21](#). provide a quick overview.

Changed values of the motors must also be taken into account (e.g. higher starting torques, higher breakdown torques, higher speeds, higher power reserves, higher weight).

In the following we explain how you can use the higher starting and stalling torques in connection with the extended operating range to your advantage.

The graphs show the principle efficiency characteristics of asynchronous motors

IE3 - Premium

Motors with efficiency class IE3 achieve a further improvement of efficiency. This increases the thermal reserves and therefore the possibilities for use. In the standard powers, NORD motors retain the standard sizes even with IE3. This is possible by the use of selected materials and innovative production technology. The wide voltage range is not indicated on the rating plate. However, operation as for IE2 motors is still possible. However, IE3 efficiency cannot be completely guaranteed.

The 4-pole IE3 motors are also suitable for 50Hz and 60Hz, which makes them suitable for use throughout the world.

[NORD provides information on this under:](#)

www.nord.com / Products / Energy Efficiency Drives / National Regulations.

Electro~Motor.ir

IE4 / IE5 - The next level

Motors with efficiency class IE4 achieve a further efficiency improvement. NORD has developed permanently excited synchronous motors for inverter operation in the power range up to 5.5. kW.

Further information about IE5 motors can be found in catalogues M5000.

Up date and careful

This catalogue was produced with the greatest care on the basis of the present legal situation. We cannot accept any warranty for technical changes.

Please note that standards and directives are subject to constant change. Even though we make every endeavour to ensure that this information is correct, this document cannot provide a substitute for a study of the relevant directives or import regulations.

Versions

Versions according to DIN EN 60034-7

The same dimensions apply for the following versions:

IM B3 ⇒ IM B6, IM B7, IM B8, IM V5, IM V6

IM B5 ⇒ IM V1, IM V3

IM B14 ⇒ IM V18, IM V19

The motors can be ordered in the basic version and operated according to the above list (universal version) The installation position must be stated for versions with a condensation drain hole (KB). For versions IM V5, IM V1, IM V18 we recommend the version with a protective shield (RD).

The labelled installation position of the gear unit must be observed for geared motors.

Dimension designations as per DIN ISO 50347

⇒  D2-21 Fits:

D, DA	≤ 30	j 6
	> 30	k 6
N	≤ 250	j 6
	> 250	h 6
H		-0,5

Parallel key grooves + parallel keys as per DIN 6885/1

Threaded holes DB + DC as per DIN 332/2

Classification of power, shaft journals and flanges;

Shaft parallelism / foot surface; shaft concentricity

Flange / Shaft runout as per DIN EN 50347

Motor selection

Selection of a suitable motor

A number of factors must be considered for the selection of a motor. These include e.g. its power, speed, variable speed range, torque, size, the necessary motor options and the ambient conditions. Several aids for motor selection are listed below.

Motor designation

Motors are designated according to their axis height and their rated power. The axis height designates the dimension between the centre of the output shaft and the foot contact surface of a foot-mounted motor. Motors are stamped with a rated power according to DIN EN 50347 Compliance with the standard means that the powers of the motors increase in standardised increments - e.g. for 4-pole motors from 0.12 kW through 0.18 kW up to 0.25 kW etc.

The power which a motor can actually provide in compliance with its thermal class is usually higher than the rated power but less than the next highest power level.

Determination of the approximate motor speed

According to the version, a differentiation between 2, 4, 6 and 8-pole motors is made in this catalogue. The rounded idling speeds of these motors is stated in the following table

Number of poles	2	4	6	8
Idling speed [rpm] (rounded) 50Hz	3000	1500	1000	750

The most commonly used geared motors have 4 poles. Due to its popularity, this motor has the shortest delivery time and has a good power to price and weight ratio.

With geared motors, the output speed of the gear unit is determined by the motor speed and the speed ratio of the gear unit.

The following relationship applies:

$$\text{Gear unit output speed} = \frac{\text{Motor speed}}{\text{Gear unit speed ratio}}$$

The speed of the motor changes slightly under the influence of the load. The higher the load (the torque which must be provided), the lower the speed. This effect is greater with smaller motors. Rated values which are described in the catalogue and on the rating plate always relate to the speed at the rated power.

In addition extended operating points are described for IE3 motors ⇒  A14, in which higher powers can be obtained from the motors. The speed at this operating point deviates from the rated speed. In addition, switchable pole motors are described, which have 2 rated speeds.

Selection of motor power

The power or the speed which the driven machine requires is important for selection of the motor.

In this catalogue, the power is stated in kilowatts [kW] and the torque is stated in newton metres [Nm]. Depending on the drive application, calculation of the necessary power or torque is complex.

The following explanations and technical data assist with the design of a drive unit which is performed with the aid of calculation programs such as NORD-AAP or with technical formularies. The power which is stamped on the motor rating plate depends on the mode in which the motor is operated.

Electro~Motor.ir

Explanation of the main operating modes

Continuous operation	with constant load	S1
Short-term operation	with constant load Thermal equilibrium is not reached. The motor is only switched on again if the motor has cooled to a maximum of 2K above the cooling air temperature. Example: S2-10min. Recommended values for specification: 10, 30 min	S2
Intermittent operation	consisting of similar load cycles with phases of constant load and subsequent pauses. The frequency and heaviness of starting must not have a significant influence on heating. Unless otherwise agreed, a cycle time of 10 minutes is assumed. The relative duration of switch on states the ratio of the operating time to the cycle time. Example: S3-40% ED: 4 min Load - 6 min pause Recommended values for specification: 40 % – Deviating values on request!	S3
Cyclic operation	with high switching frequency ⇒  A25 External fan (F)	S4
Continuous operation	with intermittent load consisting of similar load cycles with phases of constant load and subsequent idling. Cycle time and relative switch-on time are as for S3. Example: S6 - 40% ED Recommended values for specification: 40 % – Deviating values on request!	S6
Uninterrupted operation	with non-periodic changes of speed and torque A mode in which, in general, the load and speed change non-periodically within the permissible operating range. In this mode, there are frequent overloads which may be far in excess of the full load. Example: S9 – Statement of average power!	S9

Operating modes

Continuous operation The listed values of NORD motors in the catalogue apply for continuous operation (S1). In practice, motors frequently only operate for brief periods or with frequent interruptions.

Note

Power increase in short-term and intermittent operation

In short-term (S2) and intermittent (S3) mode, electric motors can be subjected to greater loads than in continuous operation (S1). The factors for the permissible power increase in relation to the rated power (P_N) for continuous operation are listed in the following table. In principle, the power may only be increased to the point where the relative breakdown torque (M_k/M_N) divided by the power increase factor results in a value of ≥ 1.6 . In individual cases, higher factors than those which are stated in the table may result. These will be notified on request.

	S2	permissible power	S3	permissible power	S6	permissible power
10min		$1,40 \times P_N$	25%	$1,33 \times P_N$	25%	$1,45 \times P_N$
30min		$1,15 \times P_N$	40%	$1,18 \times P_N$	40%	$1,35 \times P_N$
			60%	$1,08 \times P_N$	60%	$1,15 \times P_N$

For greater switch-on frequencies and heavy starting, the motor design and classification of the operating mode should be carried out by NORD. For this, details must be provided with regard to the:

- ▶ Relative switch-on duration
- ▶ External moment of inertia
- ▶ Switching frequency
- ▶ Load torque relative to speed
- ▶ Type of braking

Electro-Motor.ir

Motor selection

Total torque

The necessary total torque for driving a machine is comprised of the

- ▶ Static torque
- ▶ Dynamic torque

Static torque

The static torque is necessary to operate a machine under constant load and at constant speed. Depending on the machine which is to be driven, friction, efficiencies and lifted loads etc. are taken into account for calculation of the static torque.

Dynamic torque

Torque is also required to accelerate inertial masses. The inertial mass is subdivided into the mass of the load which is to be accelerated and the rotating mass of the motor (rotor).

For calculation of the starting and braking characteristics of the drive, all of the accelerated moments of inertia which act on the motor shaft are included and added together.

$$J_x = \frac{J_L}{i_{Ges}^2}$$

J_x External moment of inertia reduced to the motor shaft [kgm²]

J_L Moment of inertia of the load [kgm²]

i_{Ges} Gear unit speed ratio

If a gear unit is used between the load and the motor, the calculated moment of inertia of the load reduces according to the square of the gear unit speed ratio. The moment of inertia of the gear unit can usually be neglected, as it is small in relation to the moment of inertia of the motor.

The motor torque is calculated using the following formula:

$$M_a = \frac{\pi}{30} \cdot J \cdot \frac{\Delta n}{t_a}$$

The acceleration torque M_a of a motor depends on the total moment of inertia reduced to the motor shaft J , the required speed change Δn and the required acceleration time t_a .

⚠ For mains operation, the acceleration time must not exceed 4 seconds in order to prevent the motor from overheating.

In the catalogue, the acceleration torque for mains operation M_a is described in relation to the rated torque M_N , e.g. $M_a / M_N = 2.3$.

Due to the change in torque from standstill up to the rated speed, approx. 90% of the acceleration torque can be utilised during the acceleration time (see &A13 Illustration of torque characteristic curve).

For inverter operation with NORD frequency inverters, the ratio M_a / M_N has a value of 2.0 for a period of 3 seconds and 1.5 for a period of 60 seconds and is therefore less than when starting with mains operation.

Power, torque, speed

The relationship between power, torque and speed is described by the following formula, into which alternatively the output speed and output torque for geared motors or the motor speed and the motor torque for motors can be entered. The motor power which is stamped on the motor rating plate and stated in the catalogue is the mechanical power which is delivered. Due to the efficiency of the motor, the electrical power which is consumed by the motor is considerably greater than the output power.

$$P_1 = \frac{M_2 \cdot n_2}{\eta \cdot 9550}$$

P_1	Power	[kW]
M_2	Torque	[Nm]
n_2	Speed	[min ⁻¹]
η	Gear unit efficiency	[%]

The example in the illustration shows the torque graph for a 90 kW asynchronous motor with mains operation. The load curve may differ depending on the application. The intersection of the load curve and the motor characteristic curve is the operating point of the motor. The operating point usually differs from the rated point, which explains the difference between the actual speed which occurs in the application and the rated speed according to the catalogue.

Electro~Motor.ir

Torque curve

Load curve and motor curve (starting with mains)

Comparison of NORD motor torques

There are many years of empirical experience for the selection of motors, which can only be roughly transferred to the new IE3 motors. In spite of their essentially identical dimensions, the motor types differ with regard to their torques. The rated torque M_N largely remains the same, as the rated power remains constant and the rated speeds are also largely unchanged.

NORD motors have high acceleration and breakdown torques. Most NORD IE3 motors have even higher values. These high acceleration torques can be used to assist acceleration processes, e.g. To change from static to dynamic friction or to start pumps.

Motor selection

Overload capacity of IE3 motors

The large thermal reserves of IE3 motors can be taken into account for the design of the drive. The following table describes the maximum continuous thermal load within thermal class F with reduced efficiency.

1500 / 1800 1/min 50 / 60 Hz		Extended operating range									
P _{max} ISO F *

* Supplement for motors ⇨ C12 ** APAB series

Inverter operation

Frequency inverter operation

The use of frequency inverters considerably extends to possibilities for using three-phase motors and geared motors in comparison with simple mains operation.

The advantages at a glance:

- ▶ Continuous speed variation over a wide range
- ▶ Automatic speed-load adjustment through slip compensation with vector inverters
- ▶ Programmable acceleration ramp for gentle starting, which protects the drive and the application and prevents high starting currents
- ▶ Controlled, adjustable delay down to standstill (only a holding brake may be required)
- ▶ Many software-based functions are available for controlling and monitoring the drive, including dynamic positioning with NORD inverters.
- ▶ Possibility of energy saving through process modification or optimisation as well as the energy saving function of NORD inverters

NORD three-phase motors (not switchable pole) are suitable for operation with commonly available frequency inverters. Through the use of double-lacquered wire and phase insulation the windings are protected against damage due to rapid voltage increases such as occur with modern inverters with pulse width modulation. The use of dv/dt or sinusoidal filters is necessary for motors with inverter operation above 500V.

With inverter operation, motors can produce their full rated power in continuous operation.

In general there is no restriction for motor options with inverter operation. The motor brake and external fans may not be supplied from the motor power supply.

The type of encoder system (incremental or absolute encoder) depends on the requirements of the application, the type of signal (TTL, HTL, SSI, CANopen) and the type of frequency inverter or encoder interface which is used.

In general it is advisable to equip each speed-controlled drive with temperature sensors and to evaluate these via the frequency inverter. This protects the motor against overheating.

Inverter operation - characteristic curves and planning

Some important questions, such as

- ▶ the lowest possible frequency or speed,
- ▶ Frequency increases above 50Hz,
- ▶ Power increase of three-phase motors with the 87Hz characteristic curve,
- ▶ Extended variable speed range with the 100Hz characteristic curve,

we would like to introduce and answer them here that contribute to the optimal use of frequency converter drives. The three-phase asynchronous motor can in principle be operated in the adjustment range from 0 to 2 times the nominal speed. The maximum speed is determined by mechanical limits.

Lowest possible frequency or speed

At low speeds, cooling by the motor fan is greatly reduced. As a result, the typical thermal losses of the motor are not adequately dissipated and overheating may occur in continuous operation. With operation at the rated load, this range starts at speeds which are $< 1/2$ of the rated speed (25Hz).

This can be remedied by the use of an external fan which completely eliminates the thermal problem.

Continuous operation is then possible even with the lowest possible speeds ($2 \times 5\text{Hz}$ slip frequency).

Alternatively, a larger motor can be used.

With this, the drive is operated with a reduced capacity. Therefore there is also a lower power loss with an additional increase in the thermal reserve due to the larger size of the motor.

The possible torque, overload and smooth running essentially depend on the performance of the frequency inverter which is used. A low required speed or speed "0" may only be possible with the use of speed feedback via an encoder.

Electro~Motor.ir

Motor selection

Design according to the 50Hz characteristic curve (standard design)

Adjustment range 1 : 10 (5 - 50Hz)

Three-phase asynchronous motors are designed for a rated operating point (e.g. 400V/50Hz). Up to its rated frequency the motor is able to develop its rated torque.

Depending on the frequency, the speed of a 4-pole motor can be calculated as follows:

$$n_{Hz} = [(1500 \text{ rpm} \cdot f_{Hz}) / 50\text{Hz}] - \text{Slip speed}$$

For 4-pole motors, depending on the speed, the relationship between the power and torque is as follows:

$$M = \frac{P \cdot 9550}{n}$$

A speed reduction < 50 Hz does not result in increased torque as is the case with variable speed gear units, but rather results in a power reduction. For constant torque the current remains constant and the voltage reduces with the frequency.

A further frequency increase in the weak field range therefore results in a torque reduction.

Above the rated frequency the available torque reduces, as at higher frequencies the voltage is no longer increased. The magnetic flux reduces. This range is referred to as the weak field range.

The effect is explained in the following 50Hz characteristic curve:

Electro~Motor.ir

Physical conditions for constant torque:

$$M = \text{Constant} \Rightarrow \Phi = \text{Constant} \Rightarrow V/f = \text{Constant}$$

Torque Magnetic flux Voltage/frequency

The condition $V/f = \text{Constant}$ can only be implemented by the frequency inverter at most up to the rated operating point ($V_{nenn}/f_{nenn} = \text{Constant}$). A further voltage increase above the mains voltage is not technically possible.

The torque reduces according to the relationship

$$1/x \Rightarrow M_{AB}/M_{NENN} = f_{Nenn}/f_{AB}$$

Minus further additional losses, due to the increased frequency

Example:

1.4X rated frequency = 70Hz

$$M_{70\text{Hz}} = \frac{f_{NENN}}{f_{AB}} \cdot M_{NENN} = \frac{50\text{Hz}}{70\text{Hz}} \cdot M_{NENN} = 71\% \cdot M_{NENN}$$

Under certain circumstances the weak field range may start before the actual point for the type is reached.

Possible causes of this are voltage losses due to the frequency inverter as well as chokes or long cable lengths.

In the weak field range, in particular the reduced overload capacity of the drive must be taken into account, because the field weakening causes a large reduction in the breakdown torque of the motor.

The torque reduction for self-ventilated motors at frequencies < 25Hz applies for continuous operation.

The normal acceleration and overload torques for short-term operation are also available on the frequency inverter.

If applications do not require a constant torque over the entire adjustment range, this must be taken into account.

For example, centrifugal pumps and fans have a quadratically increasing characteristic curve, which favours operation at low speeds.

Design according to the 87Hz characteristic curve (for 4-pole asynchronous motors)

Adjustment range 1 : 17 (5 - 87Hz)

The advantage of this design is an increase of the motor power and speed above the rated values for the motor at constant torque. This results in a greater adjustment range of 1:17 or greater, or selection of a smaller motor for the given power with adaptation of the speed ratio. This also achieves an improvement in efficiency.

Disadvantages are louder (fan) noises and the possible necessity for an additional gear unit stage.

With the 87Hz characteristic curve the same thermal restrictions apply in the low speed range as for the 50Hz version ⇒  A16.

The weak field range only begins above the cut-off frequency of 87Hz.

This mode of operation is possible if the following conditions are taken into account:

- ▶ The motor must be wired for 3~230V, i.e. For 230/400V motors → Delta circuit (motors with 400/690V windings are not suitable for this operating mode and mains with 230V per phase)
- ▶ The frequency inverter must have an operating voltage of 3~400V and the rated output current must at least correspond to the delta current of the motor. From this, it follows that:

$$\frac{\text{Inverter power}}{\text{Rated motor power}} > 1.73$$

- ▶ Due to the higher maximum motor speeds, the speed ratio of the gear unit may need to be redetermined.

Remarks

With this configuration

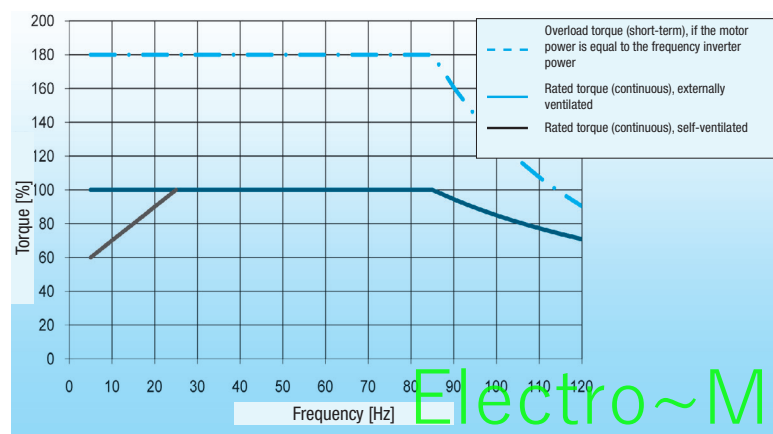

- 230V/50Hz motor on a frequency inverter with 400V
 - ▶ the rated operating point is at 230V/50Hz
 - ▶ extended operating point at 400V/87Hz.

Due to the increase of the operating point from 50Hz to 87Hz with constant torque, the motor power also increases by a factor of $\sqrt{3} = 1.73$.

Operation of a 230V motor at 400V is completely non-critical, as the motor windings are designed for test voltages > 2000V.

The effect is explained in the following 87Hz characteristic curve:

It must be noted that the rated torque of the motor is not increased. In particular, the behaviour does not change in the range from 0 to 50Hz. The normal adjustment range is 1:17 or greater.

Motor selection

Design according to the 100Hz characteristic curve (for 4-pole asynchronous motors)

Adjustment range 1 : 20 (5 - 100Hz)

The weak field range extends over the entire range up to the 100Hz point, which results in a very large adjustment range. Lower speeds can also be better utilised because the three-phase motor is operated with a lower torque.

This is achieved because the motor is not operated at its thermal limit, but in spite of this is operated with precisely matched motor data by the vector-controlled frequency inverter.

This mode of operation is possible if the following conditions are taken into account:

- ▶ The motor must be designed for 3~230V, i.e. for 230/400V motors → delta circuit.
- ▶ New 100Hz motor data need to be calculated → contact Getriebebau NORD
- ▶ The frequency inverter must have an operating voltage of 400V.
- ▶ The frequency inverter power must be one standard level higher than that of the motor.
- ▶ Due to the higher maximum motor speeds, the speed ratio of the gear unit may need to be redetermined.

Remarks

With this configuration the rated operating point of the DS standard motor is 400V/100Hz. This is made possible by recalculation of the motor data by Getriebebau NORD.

The resulting torque is available over the entire adjustment range (5...100Hz) and is somewhat below the standard value for the particular motor size.

Depending on the motor size, the reduction of the output power is between 30 and 40%, which however is compensated by the greater speed reduction for the same output speed.

The effect is explained in the following 100Hz characteristic curve:

Allocation of frequency inverters and motors

The frequency inverter is selected considering the characteristic curves depending on mains voltage and rated motor current. For this, the following applies: Rated inverter output current \geq rated motor current.

4-Pole asynchronous motors have become established as the standard on the market. However, in principle motors with other numbers of poles can be operated with an inverter. For 2-pole motors, the suitability of the motor for the gear unit should be checked. Permissible maximum motor speeds are to be observed, ⇔ [Chapter C](#).

In addition to the SK500 control cabinet inverter, NORD also supplies the SK180E and SK200E decentralised frequency inverters with a higher protection class for direct attachment to the motor. In connection with decentralised inverters, some special features are to be observed with regard to motor options, e.g. brake control directly via the inverter.

Further information can be found in the E3000 catalogue and in the manuals for the corresponding product family,

⇔ www.nord.com / Documentation / Manuals.

Design with the operating point at 70Hz

A further variant to obtain an increased adjustment range is a design with the operating point at 70Hz. This method utilises the 50Hz characteristic curve, but specifies the gear unit speed ratio so that the maximum speed is only achieved at 70Hz. In rare cases, a further gear unit stage is required for this. In comparison with the 50Hz characteristic curve, nothing changes with regard to the frequency inverter and the motor.

Advantages

- ▶ The adjustment range increases to 1 : 14 (5 - 70 Hz)
- ▶ Higher torques over a large part of the adjustment range, especially 5 - 50 Hz

Above a frequency > 70 Hz, as a result of field weakening the torque decreases more than it increases as a result of the higher gear unit speed ratio.

Calculation of torque

Typical geared motor, mains operation	Typical geared motor, with frequency inverter
<ul style="list-style-type: none"> ▶ $n_2 = 100 \text{ rpm}$ ▶ $M_2 = 100 \text{ Nm}$ ▶ $f = 50 \text{ Hz}$ 	<ul style="list-style-type: none"> ▶ $n_2 = 10 - 100 \text{ rpm}$ ▶ $M_2 = 100 \text{ Nm}$ ▶ $f = 7 - 70 \text{ Hz (approx.)}$
$P = (100 \text{ Nm} / 9550) \cdot 100 \text{ rpm}$ $P = 1.05 \text{ kW, Selected} = 1.1 \text{ kW Motor } 90S/4$	$P = (100 \text{ Nm} / 9550) \cdot 100 \text{ U/min}$ $P = 1.05 \text{ kW, Selected} = 1.1 \text{ kW motor}$
$i = 1500 \text{ rpm} / 100 \text{ rpm} = 15$	$i = 2100 \text{ rpm} / 100 \text{ rpm} = 21$
$M_{N(50\text{Hz})} = (1.1 \text{ kW} \cdot 9550) / (1500 \text{ rpm} / 15)$ $M_{N(50\text{Hz})} = 105 \text{ Nm}$ $M_A = 2.3 \cdot 105 \text{ Nm} = 240 \text{ Nm}$ $2.3 = M_A/M_N$ with motor 90S/4	$M_{N(50\text{Hz})} = (1.1 \text{ kW} \cdot 9550) / (1500 \text{ rpm} / 21)$ $M_{N(50\text{Hz})} = 147 \text{ Nm} \quad M_{N(70\text{Hz})} = 105 \text{ Nm}$ $M_A = 1.7 \cdot 147 \text{ Nm} = 250 \text{ Nm}$ with an assumed frequency inverter overload of 1.7x

Maximum motor speed

Above the speeds described below, special measures are required (Viton radial shaft seals on the A + B side). All details always relate to the operating mode S1 - continuous operation. For short periods, the motors can deliver higher speeds even without modification.

Type	Maximum speed [rpm]
63	2500
71	2500
80	2860
90	3400
100	3500
112	3500
132	3300
160	3200
180	3100
225	2800
250	2800

Electro-Motor.ir ** Option Z is not available for IE3 in the sizes 63 and 71

1) Under certain circumstances option HL must be mounted in a swivelled position - see WN-0-900-03

Options

External earthing terminal (ERD)

A corrosion-resistant earthing terminal is fastened to the motor housing in the form of a flat terminal with a clamping clip or as a terminal lug.

e. g.: 112 MP/4 ERD

Thermal motor monitoring (⇒ A40)

NORD offers two thermal protection components for an extra charge.

- **TW** = Bi-metal thermostat
- **TF** = PTC resistor temperature sensor

Protective cover (RD)

Protection against rain and entry of foreign bodies for vertical installation with the shaft facing downwards. For Ex motors according to DIN EN 50014 the protective cover is generally prescribed for the vertical version with downward-facing shaft.

e. g.: 112 MP/4 RD **IM V5** (⇒  from D3)

Double fan cowl (RDD)

Protection against rain and snow and entry of foreign bodies for vertical installation with the shaft facing downwards. Protection against water jets from all directions;

e. g.: 132 SP/4 RDD **IM V1** (⇒  from D5)

Condensation drain holes (KB)

Depending on the installation position there are condensation drain holes at the lowest point of the A or B bearing cover. These are closed with pan head screws.

 The version must be stated!

e. g.: 71 SP/4 KB **IM B3**

Before commissioning and during operation the condensation drain holes must be opened at regular intervals to drain off condensation.

Anti-condensation heating (SH)

An anti-condensation heater must be used in case of severe temperature fluctuations, high humidity or extreme climatic conditions. This prevents condensation inside the motor.

The anti-condensation heater must never be switched on while the motor is running!

For versions with TF or TW the brake terminal box is used.

 Dimensions

Available version: 110 V; 230 V; 500 V

 State the required connection voltage!

e. g.: 100 LP/4 SH 230V

Silumin rotor (WU)

For conveyor technology applications without inverter supply;

e.g.: 90 S/8-2 WU

 **Not possible for IE3 motors!**

Hand wheel (HR)

Motors with hand wheel mounted on the 2nd shaft journal;

e. g.: 132 MP/4 HR (⇒  D16)

Humidity protection insulation (FEU)

For motors used in humid environments we recommend the version with humidity protected insulation.

e. g.: 71LP/4 FEU

2. Shaft journal (WE)

Motors with 2nd shaft journal, B-side Motors with or without brake

This option cannot be combined with the options(⇒  D3-D13)

- ▶ External fan (F)
- ▶ Encoder attachment (IG)
- ▶ Protective cover (RD)
- ▶ Protective cover, textile fan cowl (RDT)
- ▶ Double fan cowl (RDD)

The transmissible power as well as the permissible axial forces for the 2nd shaft journal can be provided on request.

e. g.: 112 MP/4 WE

Electro~Motor.ir

Protective cover, textile fan cowl (RDT)

These motors have a specially designed fan cowl for use in the textile sector. Elimination of the normal fan grille prevents lint and fluff from accumulating and impairing the motor cooling.

- ⚠ Possible for motor type 63 to 132;
e. g.: 80 SP/4 RDT IM V5 (⇒  D3)

Tropicalisation (TRO)

We recommend the tropicalised version for motors which are used under extreme climatic conditions (tropics);

e. g.: 71 LP/4 TRO

One-piece terminal box (EKK)

Version with a small, one-piece terminal box. Note the cable entry (⇒  A40);

e. g.: 63 LP/4 EKK (⇒  D18)

- ⚠ Not possible with the Brake option!

Type	g1 [mm]	n [mm]	p [mm]	S3 (EKK)
63	100	75	75	2x M16 x 1,5
71	109	75	75	2x M16 x 1,5
80	124	92	92	2x M20 x 1,5
90	129	92	92	2x M20 x 1,5
100	140	92	92	2x M20 x 1,5
112	150	92	92	2x M20 x 1,5
132	174	105	105	2x M25 x 1,5

Encapsulated terminal box (KKV)

The interior of the terminal box base is encapsulated;

e. g.: 80 LP/4 KKV

Back stop (RLS)

Back stops are used to prevent backward rotation due to the load when the motor is switched off.

A drive with a back stop can only run in one direction. The required direction of rotation of the drive must be stated on ordering:

e. g.: 100 LP/4 RLS CW

- ⚠ Caution with motors with higher numbers of poles (>4) and with FI operation. It is essential to observe the lift-off speed! The back stop only operates without wear above the lift-off speed.

Type	RLS [Nm]	Lift-off speed n [min ⁻¹]	Motor extension x _{RLS} [mm]
80	130	860	64
90	130	860	75
100	130	860	91
112	370	750	93
132	370	750	107
160	890	670	135
180 .X	890	670	135
180	1030	630	127
200	1030	630	127
225	1030	630	180
250.W	3600	400	180

See Brake Motors for the motor length!

- ⚠ The required direction of rotation of the motor must be stated on ordering!

CW = Clockwise – Direction of rotation in the clockwise direction, right-hand running

CCW = CounterClockwise – Direction of rotation in the counter-clockwise direction, left-hand running

Options

Types of cooling for motors

Overview of cooling types EN 60034-6

Designation	English short form
IC410 without fan	TENV
IC411 self-ventilated	TEFC (Standard)
IC416 externally ventilated	TEBC

⚠ The following minimum distances must be observed for installation with limited air supply:

Length of motor + protective shield (LS) minus motor length (L)
⇒  D2-3

Internal fan with fan cowl IC411 TEFC

Internal fan + fan cowl is the standard version for all motors in this catalogue.

The radial fan cools independently from the rotation direction and is made of plastic. The fan cowl is made of coated sheet steel.

Metal fan (ML) IC411 TEFC

An optional metal fan wheel can be ordered in place of the plastic fan wheel.

Additional flywheel (Z) IC411 TEFC

Motor with cast iron fan for more gentle acceleration with mains operation.

⚠ Motor extension as with brake motors!
⇒  D14-15

Type	Power code	Moment of inertia J_2 [kgm ²]
63	S/L	0,00093
71	S/L	0,0020
80	S/L SH/LH SP/LP	0,0048
90	S/L SH/LH SP/LP	0,0048 0,0100 (for brake 40 ⇒  B11)
100	L/LA LH/AH LP/AP	0,0113
112	M MH MP	0,0238
132	S/M/MA SH/MH/LH SP/MP	0,0238

z.B.: 90 S/8-2 Z

Without fan (OL) IC410 TENV

Without fan / Without fan cowl (OL/H)

Option (OL) = Motor without fan with fan cowl

Option OL/H = Motor without fan and without fan cowl

e. g.: 63 S/4 OL/H (⇒  D18)

Advantage: ▶ no fan noise,
▶ reduced length with option OL/H

⚠ Reduction in power or only for operating mode S3 - 40%
Not possible for efficiency class IE3!

External fan (F) IC416 TEBC

Typical applications for external fans are drives which are controlled by frequency inverters, which can be operated over a long period at low motor speeds and full nominal torque.

External fans are also frequently used for applications in cyclic operation with high switching frequency (S4 mode).

The external fan is integrated into the fan cowl of the motor and is suited for ambient temperatures from -20°C to +60°C.

The version is standard with

- ▶ ISO class F (24 VDC special version ISO class E)
- ▶ Protection class IP66
- ▶ CE + cURus approval

External fans on NORD motors are universally suited for 50Hz and 60Hz operation in single phase and three-phase networks.

All external fans have a separate terminal box and are available in special design with a HARTING plug connector.

External fans cool the motor regardless of the speed of the motor and with appropriate switching, even when the motor is switched off.

The external fan must be connected separately from the main motor and the main motor should be protected against failure of the external fan by using thermistors (TF).

The external fans are as follows according to the motor sizes

- ▶ 63 - 112 2-pole
- ▶ 132 - 250 4-pole

Electro~Motor.ir

Technical data - External fan (F) IC416 TEBC

Standard circuit for external fans:

- ▶ Single phase operation / Steinmetz circuit
for motor sizes 63 - 90 (230V standard) and motor size 63 - 112 (115V special)
- ▶ Three-phase operation Δ - or Y- Circuit
for motor sizes 100 - 250

Standard version: External fan for 50 Hz and 60 Hz operation

50 Hz	Single phase operation

Encoder

Magnetic incremental encoder (MG)

An economical, robust and flexible incremental encoder system is available for NORD motors with axis heights from 63 to 180. The system operates on the basis of a contactless magnetic measuring principle and does not require separate bearings. Because of this it is very resistant to vibrations and is not sensitive to impacts which act on the drive unit.

The encoder is mounted on the B side of the motor. The magnetic encoder is mounted using a threaded hole on the shaft and the evaluation sensor is mounted on the fan cowl. The alignment of the system tolerates +/- 1 mm in all three axes. By means of a special design of the magnetic system, use in the vicinity of electrical brakes is also possible.

The encoder provides 2 output channels (Track A and B) which deliver pulse flanks which are staggered by 90°. This enables detection of the direction of rotation and quadruples the number of pulses.

The lowest resolution supplied by NORD is provided by an encoder with 1 pulse per revolution (1ppr) which delivers a "1" and then a "0" for each 180° of rotation of the motor shaft.

This enables economical monitoring which does not require a fast PLC or counter input. The pulse time may fluctuate slightly, as the absolute accuracy is typically 200 ppr.

In addition, NORD offers a magnetic encoder with zero track setting (MGZ), which can take over the simple tasks of an incremental encoder. This version is available in a 1024 ppr version.

Wire connection / colour	Function connection
red	Power supply (+)
black	Power supply (-)
brown	Channel A
orange	Channel B
green	Zero track setting (MGZ only)

Technical data	Value range
Standard resolutions	1 ppr, 32 ppr, 256 ppr, 512 ppr, 1024 ppr (Pulses/revolution)
Output signals (Track A and B)	HTL push-pull level / max. 40 mA / short-circuit protected
Supply voltage and current consumption without load	10-30 VDC / < 30 mA (MGZ = 8-35 VDC)
Technical EMC and ESD resistance	EN 55022: Class B (30...1000 MHz) EN 61000-4-4, EN 61000-4-5: 1 kV EN 61000-4-2: Kontakt 4 kV/Luft 8 kV EN 61000-4-6: 10 Vemk EN 61000-4-3: 30 V/m EN 61000-4-8: 30 A/m
Temperature range	-20 ... 80°C
Speed range	0 ... 5000 min ⁻¹
Protection class	IP68
Length of connection cable and sheath cross section	1000 mm / Ø 4,9 mm
Number and cross-section of conductors	4x Ø 0,34 mm ² (AWG22) (MGZ = 5x Ø 0,34 mm ²)
Changes of motor dimensions	max. 20 mm longer

Electro~Motor.ir

Magnetic encoder system mounting

Due to an automatic alignment function, mounting of the magnetic encoder system is very simple. Alignment is carried out automatically by tightening the screws on the fan cowl and the sensor housing.

In the subsequent trial run the auxiliary alignment cams are slightly worn down by the counter plate. The connection cable is then fastened to the fan cowl and passed to the terminal box according to the version.

⚠ Motor extension with magnetic encoder ⇒  D17.

Encoder

Incremental encoder (IG)

Modern drive applications often require speed feedback. Depending on the respective design, incremental encoders absorb the pulses magnetically or photoelectrically via sliding contacts.

Incremental encoders (IG) used in NORD applications normally operate according to the photoelectric method by scanning a disc with alternating lines and spaces. Alternatively, incremental encoders are used where the scanning is done magnetically (MG).

The integrated electronics converts the measuring signals into a digitalised square wave signal according to TTL or HTL logic. There are types with differing resolution/pulse numbers. Standard encoders have 4096 pulses per rotation.

The following configurations can be implemented in combination with NORD frequency encoders:

- ▶ Speed control with large adjustment range
- ▶ Highly accurate speeds, independent of the load
- ▶ Synchronisation control
- ▶ Position control
- ▶ Standstill torques
- ▶ High overload reserves

Technical data	Type / Number of pulses		
	IG1 / 1024 IG2 / 2048 IG4 / 4096	IG11 / 1024 IG21 / 2048 IG41 / 4096	IG12 / 1024 IG22 / 2048 IG42 / 4096
Interface	TTL / RS 422	TTL / RS 422	HTL push-pull
Operating voltage +U _B [V]	5 (±5%)	10...30	10...30
Max. output frequency [kHz]	300

Ambient temperature [°C]	- 20...+80		
Protection class	IP66		
Max current consumption [mA]	90	90	150

Electro~Motor.ir

Incremental encoder mounting

Encoders can be mounted on motor sizes 63 to 225.

The motors can be either self-ventilated or externally ventilated, with or without brakes. NORD hollow shaft push-in encoders are mounted directly on the B side shaft end of the motor, protected by the fan cowl. This ensures a secure, torsion-free coupling of the encoder.

Electrical connection is via a pre-assembled cable (as standard, 1.5 m long with open wire ends; other lengths or versions with plugs are possible).

Cable	Bending radius (standard)
Permanently mounted	26 mm
Flexibly mounted	78 mm

Encoder without plugs

⚠ The wire end is sealed with an ESD shield. This protects the encoder against electrostatic voltages. The connection wiring must be ESD protected!

⚠ Encoders with a protective cover (RD) are only possible with the fitting of an external fan (F)!

Exemplary sketches:

Selection of the encoder according to the output logic is determined by the interface of the evaluation electronics. The following conditions apply for NORD frequency inverters:

NORDAC frequency inverter series		Incremental encoder logic	⇒ 
SK500P, SK510P SK530P, SK550P	NORDAC <i>PRO</i> (SK500P)	* HTL with 10 – 30V supply TTL with 10 – 30V supply	BU 0600
SK520E, SK530E, SK535E, SK540E, SK545E	NORDAC <i>PRO</i> (SK500E)	TTL with 10 – 30V supply	BU 0500 / BU 0505
SK200E, SK205E, SK210E, SK215E, SK220E, SK225E, SK230E, SK235E	NORDAC <i>FLEX</i> (SK200E)	* HTL with 10 – 30V supply	BU 0200
NORDAC LINK	(SK250E - FDS)	* HTL with 10 – 30V supply	BU 0250

For further details, please refer to the operating instructions for the frequency inverter.

An external electronic module to convert HTL into TTL signals (e.g. connection of the encoder to 530P with very long cables) is available from NORD.

* up to max. 10 m encoder cable length M20x1.5).

Options

Encoder

Absolute encoders (AG)

Absolute encoders are encoders for rotational movements, which output absolute position information in the range of a revolution of the motor (360°, [Singleturn](#)) or additionally, the number of rotations with reference to a zero point ([Multiturn](#)).

Typical values are 8192 (13Bit) steps per rotation and with Multiturn, additionally 4096 (12Bit) distinguishable rotations.

[Singleturn encoders](#) are mounted on the output side of the system (typically: turntables) whereas [Multiturn encoders](#) are mounted on the output side of the gear unit or directly on the motor.

With absolute encoders the rotations are measured either entirely electromagnetically or mechanically by means of small gear stages which reduce the speed of additional bar code discs.

Advantages over incremental encoders for positioning applications

The position information is always up to date, even in case of changes of position when no voltage is present, and in the case of lost or impaired pulses.

Absolute encoders cannot be used for speed control (with NORDAC inverters).

However, combined encoders with absolute and additional incremental encoder signals are available.

Absolute encoders with various data protocols, e.g. DDI, CANopen or Profibus, are available. The selection depends on the evaluation electronics.

If required, three-phase (brake) motors with sizes 63 - 132 can also be supplied with plug connectors (type suffix: MS).

The plug connector is mounted on the side of the terminal box. Standard version pointing toward the fan cowl with II. Plug connector possible for I or III.

With sizes 63 - 112 a HAN 10 ES male connector is used on the motor side. On the customer side, a HAN 10 ES female connector is required (Harting).

Above size 132 a male HAN C Modular is provided on the motor side.

The specified contact assignment is for single speed and switchable pole motors (separated windings and Dahlander circuit). The contacts for PTC temperature sensors or thermostats as well as the brake connection voltage are specified.

The motor plug connector is supplied without the opposite connector and has a protective cap to protect against dirt.

Technical data for sizes 63 - 112

Plug connectors:	HAN 10 ES/Han 10 ESS
Number of contacts:	10
Current:	16 A max.
Voltage:	500 V max. (600 V max. according to UL/CSA)

Cage clamp spring release terminal connection

Technical data for sizes 132

Plug connectors:	HAN C-Modular
Number of contacts:	9
Current:	22 A max.
Voltage:	690 V max.

ATEX motors (Directive 2014/34 EU)

Explosive dust atmospheres occur in various areas of industry and crafts. They are usually caused by mixtures of oxygen in combination with flammable gases or circulating or deposited flammable dust. Because of this, electrical and mechanical equipment for use in explosion hazard areas is subject to special national and international standards and directives.

The term ATEX which is often used for explosion protection comes from the initial letters of an older French directive "ATmosphères EXplosible".

Building on this, the European Parliament decided in March 1994 with the EU Directive 94/9 / EC to harmonize the legal provisions for devices and protective systems for their intended use in explosion-protected areas.

In the design of mechanical and electrical equipment the objective is to avoid ignition or to limit its effects. For this, the explosion protection regulations are used.

Gas explosion protection for Zone 1 and Zone 2

- ▶ Increased safety Ex eb
- ▶ Pressure-resistant encapsulation, increased safety terminal box Ex de eb IIC

dust explosion protection

- ▶ Zone 21 and Zone 22

Zone classification for flammable gases, vapours and aerosols

Zone 1:

Is the area in which during normal operation an explosive atmosphere consisting of a mixture of air and flammable gases, vapours or aerosols can form occasionally.

Zone 2:

The area in which an explosive atmosphere of air and combustible gases, vapours or aerosols **normally does not occur**, or only occurs for a **short time** during normal operation.

Zone classification for flammable dusts

Zone 21:

The area in which an explosive atmosphere consisting of a cloud of air which contains inflammable dust can **occasionally** form during normal operation.

Zone 22:

The area in which, during normal operation, an explosive atmosphere in the form of a cloud of air which contains inflammable dust **normally does not occur**, and if so, only rarely or for a **short time**.

Increased safety (Ex eb)

For motors of device categories 2G and 3G, i.e. Ex-Zones 1 and 2, sparking and impermissible temperatures are prevented as per ignition protection type „eb“ (Increased Safety).

This is achieved by the design of the fans and fan cowls, bearings and terminal boxes. Characteristic for this is e.g. the low surface resistance of plastic fans (depending on the circumferential speed of the fan). There is a large air gap between rotating parts and large clearances and creepage distances in the terminal box.

For the selection of the model it should be noted that drive units with ignition protection type "e" often have a reduced output power when compared to the corresponding standard motor. These motors have windings which are different to those for comparable motors for non-Ex areas. This results in a genuine reduction in power! These motors are usually used up to **temperature class T3**.

Pressure-resistant encapsulation (Ex d and Ex de)

Ignition protection type "de" is a different protection concept:

Ignition protection type "de" is a different protection concept: The design of these motors resists explosions inside the motor and prevents the explosion from spreading to the surrounding atmosphere. These motors have large wall thicknesses which can withstand the pressure which results from an internal ignition. Among other things, these systems also require fans with protection class "e".

The drives provide the same rated powers as non ex-protected motors and in principle can be used like geared motors with protection class "e" in Zone 1 and 2. These motors are often used in cases where inverter operation, brakes, encoders and/or a very high level of safety are required. Typically, pressure resistant encapsulated motors supplied by NORD fulfil the requirements for **Explosion Group IIC** and **Temperature Class T4**.

Technical explanations

Efficiency

The following table shows the efficiency specifications according to the efficiency class, depending on the motor power

- ▶ for various national efficiency classifications
- ▶ for closed 4-pole motors

A direct comparison of efficiencies is not possible, because different measuring methods are used.

50Hz		IEC		Australia New Zealand	IEC	China
		IE1	IE2	AS/NZS 1359.5:2004 Level 1B	IE3	GB 18613-2020 Grade 3
[kW]	HP	η soll [%]	η soll [%]	η soll [%]	η soll [%]	η soll [%]
0,55	-	-	-	-	-	80,7
0,73	-	-	-	82,2	-	-
0,75	1,00	72,1	79,6	82,2	82,5	82,3
1,10	1,50	75,0	81,4	83,8	84,1	83,8
1,50	2,00	77,2	82,8	85,0	85,3	85,0
2,20	3,00	79,7	84,3	86,4	86,7	86,5
3,00	4,00	81,5	85,5	87,4	87,7	87,4
4,00	-	83,1	86,6	88,3	88,6	88,3
5,50	7,50	84,7	87,7	89,2	89,6	89,2
7,50	10,0	86,0	88,7	90,1	90,4	90,1
9,20	12,5	-	-	-	-	-
11,0	15,0	87,6	89,8	91,0	91,4	91,0
15,0	20,0	88,7	90,6	91,8	92,1	91,8
18,5	25,0	89,3	91,2	92,2	92,6	92,2
22,0	30,0	89,9	91,6	92,6	93,0	92,6
30,0	40,0	90,7	92,3	93,2	93,6	93,2

The actual efficiency of the motor is stamped on the rating plate. For wide range voltages, the efficiency at the least favourable operating point is stamped. At the rated voltage, the efficiency is then better than the efficiency stamped on the rating plate.

Electro~Motor.ir

Relationship between efficiency and utilisation with mains operation

For efficient utilisation of a motor it is advisable that it is operated close to its rated power. Depending on the rated power of the motor, operation under partial load may be inefficient, especially with small motors.

Relationship of efficiency and FI frequency range

For operation of a motor with a frequency inverter, the efficiency of the motor increases with the frequency with which it is operated. The following diagram illustrates this relationship using the example of a 90S/4 motor. For geared motors it must be noted that higher input speeds may result in increased gearing losses.

Electro~Motor.ir

Technical explanations

Mains connection / Rated voltages / Voltage fluctuations

Voltage tolerance as per DIN IEC 60038

DIN IEC 60038 recommends that the voltages at handover points are not allowed to deviate from the new standard voltages by more than $\pm 10\%$

Previous mains voltage	Actual mains voltage
220 V, 380 V, 660 V	230 V, 400 V, 690 V +6/-10%
240 V, 415 V	230 V, 400 V +10/-6%

Permissible voltage and frequency deviations according to DIN EN 60034-1

AC motors must operate reliably with a tolerance of $\pm 5\%$ of their rated voltage or rated voltage range and $\pm 2\%$ of their rated frequency. With this, their heating limit must not exceed Thermal Class (F) by more than 10K. The voltages or voltage ranges stamped on the motor name plates are the rated voltages or voltage ranges to which the voltage tolerance relates.

Permissible voltage deviations according to NEMA, CSA

The permissible voltage deviation according to NEMA and CSA is $\pm 10\%$ of the stamped rated voltage or voltage range.

In North America, according to ANSI C84.1 a differentiation is made between rated system voltages

- ▶ Nominal System Voltage - 120V, 208V, 240V, 480V, 600V and correspond to the nominal utilization voltages
- ▶ Nominal Utilization Voltage - 115V, 200V, 230V, 460V, 575V.

Accordingly, consumers must be stamped with the nominal utilization voltages.

Stamping of electric motors with 120V, 208V, 240V, 480V or 600V are non-standard and are not usual in North America.

System voltage	Utilization voltage
600 V	575 V
480 V	460 V
240 V	230 V
208 V	200 V
120 V	115 V

Rated voltages for NORD-motors

NORD 4-pole standard motors and IE2 motors for 50Hz are rated for the

- ▶ Voltage ranges 220-240 / 380-420V and
- ▶ Voltage ranges 380-420 / 660-725V

According to DIN EN 60 034 they operate reliably in continuous operation at $\pm 5\%$ of these voltage ranges. Therefore, reliable operation in the recommended range of the IEC standard voltages 230V, 400V and 690V +/-10% is ensured.

NORD NEMA, CSA (cCSAus), UL motors are only stamped with one rated voltage and not with a rated voltage range. The voltage deviation for reliable operation is $\pm 10\%$ of the stamped rated voltage.

Voltage and frequency

NORD three-phase motors are wound as follows:

- ▶ rated power < 3.0 kW for 230/400V Δ/Y 50Hz
- ▶ rated power ≥ 3.0 kW for 400/690V Δ/Y 50Hz

As standard, NORD motors have the following windings:

Nr. of poles	Motor type	Rated voltage	Frequency
4	63 S/4 - 100 L/4	230/400 V	Δ/Y 50 Hz
	100 LA/4 - 200 LX/4	400/690 V	Δ/Y
2	63 S/2 - 90 L/2	230/400 V	Δ/Y 50 Hz
	100 L/2 - 132 MA/2	400/690 V	Δ/Y
6	63 S/6 - 112 M/6	230/400 V	Δ/Y 50 Hz
	132 S/6 - 132 MA/6	400/690 V	Δ/Y
4-2	63 S/4-2 - 160 L/4-2	400 V	Δ/YY 50 Hz
8-2	71 S/8-2 WU - 160 L/8-2 WU	400 V	Y/Y 50 Hz
8-4	71 S/8-4 - 132 M/8-4	400 V	Δ/YY 50 Hz

Operation of 50 Hz motors on 60 Hz mains

Guideline values for conversion factors for listed values

50 Hz	60 Hz	n_N^*	P_N	M_N	I_N	M_A/M_N M_K/M_N	I_A/I_N

400V	460V	ca. 1,2	1,15	0,96	1,00	1,00	1,00
500V	500V	ca. 1,2	1,00	0,83	1,00	0,80	0,80
500V	575V	ca. 1,2	1,00	0,83	0,90	1,10	1,10
500V	575V	ca. 1,2	1,15	0,96	1,00	1,00	0,90

* The actual speed ratio depends on the motor type.

NORD motors with special windings are available for other voltages and frequencies.

Electro~Motor.ir

Special ambient conditions

Thermal class 155 (F)

NORD motor windings are produced with insulation material class 155 (F). For cooling air temperatures up to 40°C and installation altitudes up to 1000 m the maximum permissible temperature increase is 105 K.

The maximum permissible winding temperature is 155°C.

This table contains guideline values which cover the entire motor spectrum, including those with high thermal utilisation. Somewhat higher values apply for motors with low or moderate thermal utilisation. The values for motors for explosion hazard areas also differ.

	40°C	45°C	50°C	55°C	60°C
1000 m	100%	96%	92%	87%	82%
1500 m	97%	93%	89%	84%	80%
2000 m	94%	90%	86%	82%	77%
2500 m	90%	86%	83%	78%	74%
3000 m	86%	83%	79%	75%	71%
3500 m	83%	80%	76%	72%	68%
4000 m	80%	77%	74%	70%	66%

Thermal class 180 (H)

A modified version of the NORD 4-pole standard/IE1 motors is available for ambient temperatures up to 60 °C. The windings are produced in insulation material class 180 (H) and temperature-critical components are replaced with suitable components. The values on pages ⇒  C2-3 should be used for planning.

 Not all options are possible. Please contact us!

▶ Ambient temperature < -20°C and > 60°C

For cooling temperatures of < -20°C and > 60°C technical modifications to the motor may be required. The type of modification is selected according to the application.

▶ Outdoor installation ⇒ A41, 42

▶ Submersed or temporarily flooded drive

If motors or geared motors are to be operated temporarily or permanently in a submersed condition, they are selected according to the type of application. The information which is required for an offer is listed below. Submersed drives are not covered by this catalogue but rather are individually planned and offered.

- ▶ Operation in surfaced or submersed condition
- ▶ Immersion depth
- ▶ Medium in which submersed
- ▶ Medium is contaminated with abrasive materials (sand etc.)
- ▶ Temperature of medium in which submersed
- ▶ Required cable length
- ▶ Application requires bio oil / bio painting
- ▶ Operating hours per year
- ▶ Direct attachment of the motor to the gear unit is permitted (preferred)

Technical explanations

Thermal motor monitoring

A sensible motor selection protects the motor against overheating due to the application or the ambient conditions. Factors which may result in the motor overheating are e.g. overload, high ambient temperatures, restricted cooling air flow and low motor speed due to inverter operation.

NORD offers two thermal protection components for a extra charge.

- ▶ TW = Bi-metal thermostat
- ▶ TF = PTC resistor temperature sensor

These are used to directly monitor the winding temperatures with full utilisation of the motor power.

Three (one for each strand) TW or TFs connected in series are located at the hottest points of the windings. They are connected to 2 terminals in the terminal box.

⚠ TW or TF motor protection is urgently recommended for frequency inverter operation, heavy starting, switching operation, increased ambient temperature, limited cooling, etc.

Thermostats (TW)

(Other common names: Thermal NC switch, Klixon, Bi-metal NC switch)

The thermostat is an encapsulated bi-metal switch which is normally designed to be normally closed.

It must be wired so that when the switching temperature is reached the circuit breaker interrupts the motor power supply. The circuit breaker opens and switches the motor off.

The thermostat only closes its contacts again after a considerable temperature reduction.

Trigger temperature: 155° C

Rated current: 1.6 A at 250 V

Switch version: NC (terminals TB1 + TB2)

Also available as 2TW, for warning and shut-down!

Temperature sensor (TF)

(Other common names: PTC, PTC temperature sensor, PTC-Thermistor)

When the rated trigger temperature (NAT) is reached, the resistance of the temperature sensor suddenly increases to almost 10x its normal value.

The PTC temperature sensor only performs its protective function when connected to a trigger device!

A triggering device evaluates the resistance increase and switches the drive off.

Trigger temperature: 155° C

Max. voltage: 30 V

Terminals TP2+ TP2

Also available as 2TF for warning and shut-down!

e. g.: 130°C = **Warning** , 155°C = **Shut-down**

NVibration level A according to DIN EN 60034-14

NORD three-phase motors are designed according to vibration level A.

Cable glands

Geräuschmission

▶ Sound pressure level and sound power level

In accordance with DIN EN ISO 3745/44 the sound pressure level SPL is measured in an anechoic chamber with the test sample idling. The measurement surface area A [dB] is calculated from the geometrical dimensions of the test sample. The sound power level SWL is determined by adding the measurement surface area to the sound pressure level. For inverter operation a slightly increased noise level due to magnetic humming or whistling is to be expected. At higher speeds due frequencies above 50Hz or 60Hz the fan noise increases. External fans are supplied directly from the mains. Their cooling effect and noise emission do not depend on the motor speed.

Measurement surface sound pressure level and sound power level for mains operation of 4-pole motors

Electro~Motor.ir

Protection class according to DIN EN 60034-5

Protection against touching moving and electrically live components as well as entry of solid foreign bodies, dust and water. The protection class is stated by the letters IP (International Protection) and two code numbers (e.g. IP55)

1st code number	Protection class	
	Brief description	Explanation of standard IEC60034-5
5	Protection against touching, foreign bodies and dust	Complete protection against touching. Dust cannot enter in harmful quantities
6	Protection against touching, foreign bodies and dust	Complete protection against touching. Dust cannot enter
2nd code number	Brief description	Explanation
5	Protection against water	Protection against water from all directions Water cannot enter in harmful quantities.
6	Protection against water	Protection against heavy seas and strong water jets from all directions Water cannot enter in harmful quantities.

Motors for indoor installation

NORD recommends the following options for indoor installation:

	Indoor installation dry	Indoor installation wet
Motor version	IP 55 (Standard)	IP 55 (Standard)
Temperature fluctuations and/or high humidity	–	KB, SH, FEU
Vertical version	RD	RDD

Motors for outdoor installation

NORD recommends the following options for outdoor installation:

	Outdoor installation	Extreme ambient conditions
Motor version	IP 55 (Standard)	IP 66
Temperature fluctuations and/or high humidity	AS55 or AS66, KB, SH, EP	
Vertical version	RD	RDD

The option KKV (encapsulated terminal box) can be supplied for both types of installation if required by the customer.

Outdoor installation AS66 or AS55

For outdoor installation or for motors which are used in wet environments we recommend the option AS66 or AS55.

Measures for AS66	Measures for AS55 - only for brake motors
▶ Protection class IP66	▶ Protection class IP55
▶ Encapsulated terminal box	▶ Brake IP55 RG (rust-protected version)
▶ Motor bearings with sealing discs (2RS)	▶ Painting at least NORD Severe Duty 2 (⇒  A9)
▶ IP66 brake	
▶ Painting at least NORD Severe Duty 3 (⇒  A9)	

⚠ For outdoor installation of vertical versions (e.g. IM V1 or IM V5 ⇒  ab D2) we urgently recommend the option “double fan cowl” (RDD). If possible according to the version, the cable gland in the terminal box must be at the bottom.

Technical explanations	B 2 - 9

Options	B 13 - 17
Switching variants	B 18 - 21

Technical explanations

NORD brake motors

are equipped with DC-excited spring pressure brakes. The brakes prevent accidental rotation of machines (as holding brakes) or bring rotation of the machine to a standstill (as a working brake or for emergency stop).

Environment

The brake linings are asbestos-free.

Safety

The braking action is activated on interruption of the current (idling current principle).

The brake can no longer be released if the brake linings are worn.

Idling current principle

The brake disc is located between the brake bearing cover and the rotor plate. The brake disc has a brake lining on both sides. The brake disc transfers the braking torque to the motor shaft by means of the coupling. The brake disc can be moved in an axial direction on the coupling. The rotor plate presses the brake disc against the brake cover plate by means of spring pressure. The friction between the rotor plate and the brake lining and between the brake bearing cover and the brake lining produces the braking torque. The brake is released by an electromagnet (magnetic component).

After the current is switched on, the electromagnet pulls the rotor plate back from the brake lining by several tenths of a millimetre against the pressure of the spring. This allows the brake disc to rotate freely. Interruption of the current causes the magnetic force to collapse, so that the spring pressure predominates. Therefore the brake is automatically activated.

Brake activated

Brake released

Power-to-apply principle

Brakes which are activated by the force of an electro-magnet are designated as power-to-apply brakes. (Please enquire!)

 ⇒  B10
- 6th place: Protection of electronic components against vibration and moisture
 - L**: Paint coating
 - V**: Fully encapsulated

Switching variants ⇒  B18 and above

Brake torque (M_B)

According to DIN VDE 0580/2011/11, the actuation torque is defined as the value of the braking torque at a speed of 1m/s relative to the mean friction radius.

It applies for brakes which are in a run-in condition. The effective braking torque is not identical to the actuation torque and is to be regarded as a guideline value.

The actual value of the braking torque depends on the temperature, speed (frictional speed), ambient conditions (dirt, humidity) and the state of wear. These must be taken into account during planning.

If must be noted that the stated braking torques are subject to a tolerance. The precise values must be obtained from the relevant operating and installation instructions.

 The full braking torque is only available after a short running-in period.

The friction surface of the brakes must be dry. Under no circumstances must they come into contact with grease or oil! Grease or oil on the friction surfaces drastically reduces the braking torque.

Brake torques in bold type: Standard version for 4 pole motors,
other brake-motor combinations may result for different numbers of poles

H Holding brake

W Working brake

2) Option HL not possible!

Electro~Motor.ir

Technical explanations

Selection of standard motor-brake combination

The selection of a standard combination of motor and brake according to the overview above must be carried out by careful planning. The braking torque must be specified according to the requirements of the application.

It should be noted that motors of the same type, but with different numbers of poles develop very different torques, especially 4-pole motors in comparison with 8-2-pole motors (rated, starting and breakdown torques ⇒ [Table C2-C26](#))

Among other things, the design of the drive units is orientated to both the torque required for the application and the motor torque. If necessary, the braking torque must be considerably reduced (⇒ [Table B5](#)), so that there is no overload of the gear unit when large moving masses are braked (⇒ [B11](#) “Selection of brake size”).

Holding brake • Working brake • Emergency stop brake

The differentiation between a “holding brake”, a “working brake” and an “emergency stop brake” results from the type of application. A holding brake has the task of preventing a drive chain, which is at a standstill from starting to move.

As soon as a brake needs to produce amount of friction it is known as a working brake. The relevant friction and the switching frequency must be determined and taken into account for the selection of the brake (⇒ [B10-12](#)).

For the emergency stop function of a brake, large masses must be braked once and the brake correspondingly large with amounts of energy are applied to the brake. In this case, the selection of the brake must be made according to the maximum permissible friction for each braking process.

Examples for Holding brake and Working brake

Holding brake

A frequency inverter controls the acceleration and deceleration of the application. The mechanical spring-loaded brake is only applied after the application has come to a standstill.

The brake is therefore only used for “holding” the application (parking position). It does not perform any friction work.

Only in the event of an emergency stop or power failure is friction work done while driving.

Brake series

BR55PH, BR55MH, BR66PH, BR66MH

Working brake

The geared motor is directly supplied by the local voltage supply. To slow down the application, the mechanical spring-loaded brake must generate a braking torque and thus performs friction work.

The mechanical brake is also used for “holding” the application (parking position).

Brake series

BR55PW, BR55MW, BR66PW, BR66MW

Electro~Motor.ir

Electrical design

The brake windings are designed for continuous operation. At the rated voltage they heat up in a continuously released state according to heat class 130(B) (Temperature increase $\leq 80\text{K}$). The brakes are supplied with DC current. For this, current from the AC mains is rectified.

Half wave and bridge rectifiers are available as well as rapid switching rectifiers whose function will be described in the following sections. Selection of the rectifier should be made according to the requirements of the application.

Please note the section 'Excess voltages' for DC supplies without a rectifier \Rightarrow  B8!

To protect against freezing, the brakes can be electrically heated, \Rightarrow  B15 "Anti condensation heater of brakes (Option BSH)". Please ask!

Sine wave AC voltage

Voltage form for
half-wave rectifiers
 $U_{DC} = U_{AC} \times 0,45$

Voltage form with
bridge rectifiers
 $U_{DC} = U_{AC} \times 0,9$

Brake switching characteristics

The build-up of the magnetic field to release the brake and its collapse on application of the brake requires a certain amount of time. This delay is often undesirable, but it can be effectively shortened by means of suitable measures.

Activation of the brake (application)

AC switch-off
(Rectifiers GVE, GHE, GPE)

▶ Slow brake activation

If only the AC side of a bridge or half wave rectifier is disconnected from the mains, a DC current continues to flow through the rectifier until the magnetic field in the brake has been reduced.

The brake is only applied when the magnetic field has collapsed to a minimum amount. The time for the collapse of the field depends on the inductance of the brake and the resistance of the windings. As supplied, terminals 3 and 4 of the standard rectifier are connected by means of a wire bridge.

These must not be removed for AC switching.

DC switch-off
(Rectifiers GVE, GHE, GPE) and external contact

▶ Accelerated brake activation

The magnetic field of the brake collapses rapidly and the braking action occurs quickly if the interruption of the current is made on the "DC side" between the rectifier and the brake.

This interruption can be implemented by means of a contact between terminals 3 and 4 of the rectifier (see circuit example).

The contact must be suitable for the switching load due to the DC current. As supplied, terminals 3 and 4 of the standard rectifier are connected with a wire bridge.

This must be removed for DC switching. Accelerated brake activation \Rightarrow  B14 Option "Current measurement relay" (IR).

Activation of the brake (application)

Under-excitation with quick switching rectifiers (GPU, GPE) e.g. mains voltage $230V_{AC}$ and brake voltage $205V_{DC}$

▶ High speed brake activation

If the reduction of the application time by means of DC switching is not sufficient, under-excitation of the brake with the aid of a quick switching rectifier is advisable. After the brake has been released, the quick switching rectifier switches from bridge rectification to half-wave rectification. This halves the output voltage (DC) and the current (in the electrically released condition, the supply-voltage to the brake can be reduced to about 30% of the rated value without the brake being applied).

At half voltage, the energy of the magnetic field is reduced to a quarter in comparison with the energy at full voltage (the same also applies for the heating of the coil). ⇒  A39 (ISO-H)

On the other hand, switch-off is carried out by DC. A weakened magnetic field collapses more quickly than a full strength field. As a result, with this weakened field, the brake is applied more quickly than a brake with a full field.

In this switching combination, accelerated release by over-excitation is not possible!

 This switching type must not be combined with a noise-reduced brake.

Releasing the brake (Ventilation)

▶ Normal brake release

The release of the brake has already been explained in the Section "Idling current principle" (⇒  B2).

Over-excitation with quick switching rectifiers (GPU, GPE2) e.g. mains voltage $230V_{AC}$ and brake voltage $105V_{DC}$

▶ Accelerated brake release

The rapid action rectifier is briefly in bridge rectification mode (Push).

For a short time, double the rated voltage is applied to the brake. The force with which the stator disc is pulled in by the magnetic component is enormously increased due to the double voltage, so that the rotor plate is released considerably quicker and the brake is released more quickly than with normal excitation.

After the brake has been released, the quick switching rectifier switches from bridge rectification to half-wave rectification. The rated voltage is then applied to the brake terminals.

 In this switching combination, accelerated activation of the brake by under-excitation is not possible!

Excess voltage

High voltages may occur when a brake is switched off. This results in severe erosion of the switching contacts. In addition, the brake can be destroyed by the high voltage.

NORD rectifiers are equipped with an appropriate protective circuit. This prevents the occurrence of impermissible excess voltages.

Other circuits, primarily for the supply of brakes from an external voltage source, can be equipped with additional protection. Please ask!

Electro~Motor.ir

Selection of brake size

The torque and moment inertia relate to the motor speed.
Gear output torques must always be divided by the gear ratio.
Moments of inertia for the gear unit must always be divided by the square of the gear ratio.

1. Selection according to static load (holding brakes)

$$M_{\text{erf}} = M_{\text{stat}} = M_{\text{Load}} \times K$$

2. Design according to static and dynamic load (service brakes)

$$\Sigma J = J_{\text{Motor}} + \frac{J_{\text{Load}}}{i^2}$$

Other moments of inertia (brake, gear unit), can usually be neglected.

$$M_{\text{dyn}} = \frac{\Sigma J \times n}{9,55 \times \text{tr}}$$

$$M_{\text{erf}} = (M_{\text{dyn}} \pm M_{\text{Load}}) \times K$$

for a driving load: M_{Load} must be entered as positive
for a braking load: M_{Load} must be entered as negative

3. Check for maximum permissible friction

$$W = \frac{J \times n^2}{182,5} \times \frac{M_{\text{B}}}{M_{\text{B}} \pm M_{\text{Load}}} \Rightarrow W \leq W_{\text{max}} !$$

for a driving load: M_{Load} must be entered as negative
for a braking load: M_{Load} must be entered as positive

For economic and technical reasons the brakes should not be overdimensioned.

Definition of abbreviations

c/h	=	Number of braking actions per hour
ΣJ [kgm ²]	=	Sum of all driven moments of inertia, related to the motor speed
i	=	Gear ratio
K	=	Safety factor ⚠ related to the application, selection according to individual design specifications. - Guide values: 0.8...3.0 - Lifting equipment: >2 - Lifting equipment with personnel safety : 2...3 - Travelling drives: 0.5...1.5
M_{B} [Nm]	=	torque provided by the brake
M_{dyn} [Nm]	=	Dynamic torque (deceleration torque)
M_{erf} [Nm]	=	Required braking torque
M_{Load} [Nm]	=	Load torque resulting from the application
M_{stat} [Nm]	=	Static torque (holding torque)
n [min ⁻¹]	=	Motor speed
t_{r} [sec]	=	Slipping time: the time in which the drive unit should come to a standstill
W [J]	=	Frictional work per braking action
W_{max} [J]	=	Maximum permissible friction work per braking action

Options

Manual release - HL D19

The braking effect of a brake with manual release can be released without dismantling, when no current is present.

To do this, the manual release lever is pulled in the direction of the air intake. Return is by means of spring pressure.

Lockable manual release - FHL

Brakes (up to 250Nm) with manual release can be locked in the released state by means of a locking device.

Optionally, it is possible to intermediately store unscrewed manual brake release levers in a spring clip on the stator housing (Option CL  A21).

Manual release (HL) - Dimensions and forces

Brake size	Row of brakes	Lever arm [mm]	Release force [N]	Key-width [mm]	Screw-in thread	Thread length [mm]	Ventil. angle a

Microswitch – MIK

The brakes can be supplied with an attached micro switch for simple electrical monitoring of the release function.

A micro switch should be used if movement monitoring is necessary or required. The motor circuit breaker is triggered by the micro switch when the rotor disc is in contact with the magnetic part.

Then the motor can only start when the brake has released. Once the maximum air gap "a" has been reached the magnet no longer attracts the rotor disc. The motor circuit breaker is not triggered and the motor does not start. The air gap "a" must be re-adjusted.

Protection against corrosion • Dust • Dirt • Moisture - RG, SR

- 1) B bearing cover painted and stainless friction disc
- **Option RG** (only possible with protection class IP55)
- 2) B bearing cover painted and dust protection ring
- **Option SR** including stainless friction disc
(only possible with protection class IP55)
- 3) Protection class **IP66**, note motor protection type,
please ask!
- 4) Protection class **IP67** (Sea water brake), note motor protection
type, **please ask!**

Noise-reduced brake - NRB1

In order to reduce switching noise, the brakes can be supplied with an O-ring between the rotor disc and the magnetic part.

⚠ Use with rapid action rectifiers for under-excitation is not permitted.

Noise-reduced brake - NRB2

Noise due to torque oscillations in inverter operation or with single-phase motors can be effectively reduced by the use of rings on the couplings.

Options

Current measuring relay - IR

► Accelerated brake activation

Rectifiers which are directly wired to the motor terminals are supplied via the motor supply cable. This saves a separate supply line for the brake. After the motor is switched off, the brake remains electrically connected to the motor. As long as the motor has not come to a standstill, it works as a generator and continues to feed the brake via the rectifier, which considerably delays the activation of the braking effect.

This can result in an impermissible operating state, especially with loaded lifting equipment.

A current measuring relay must be used in order to achieve short application times with this switching variant. The current measuring relay measures the motor current. If the motor is switched off, the current measuring relay releases. At the same time, the brake is switched off by DC.

However, due to internal reaction times, the activation of the braking effect is slower than with normal DC switch-off.

The current measuring relay can only be used in combination with the rectifiers GVE, GHE and GPE!

Technical data	Current measuring relay (IR)	
Switching voltage	42...550 V _{DC}	
Switching current	1.0 A _{DC}	
Primary current	25 A _{AC}	50 A _{AC}
max. primary current	75A (0.2 sec)	150A (0.2 sec)
Holding current	< 0.7 A _{AC}	< 0.7 A _{AC}
max. operating temperature	-25°C...+90 °C	-25°C...+90 °C

Anti condensation heater / Brake (BSH)

In the case of severe temperature fluctuations, high humidity or extreme climatic conditions, a standstill heating system must be used. This prevents moisture precipitation inside the brake.

⚠ The anti condensation heater of the brake must not be switched on when the motor is running and when the brake is energized!

Double brake for theatre applications - DBR

Combinations of 2 brakes for example for theater applications requirements are available in noise-reduced versions.

In order to reduce the switching noise (< 50 dB(A) with AC switch-off) the theatre version of the brakes has an O-ring between the rotor disc and the magnetic part.

Redundancy:

Safety-relevant systems must be designed in parallel, so that if one component fails, the other component ensures the function.

According to DIN EN 17206, the brake must be able to hold at least 1.25 x the load (test load). It is advisable to design the brake for 1.6 x and a maximum of 2.0 x the load torque.

⚠ The coil voltages correspond to the values stated in this catalogue. Two rectifiers are required for the double brake. Combination with voltage reduction is not possible.

Note:

It is advisable to stagger the application of the brakes, as if they are applied simultaneously, the braking torques add up and can therefore cause damage to the gear unit and the system. If there is the possibility of an emergency stop, the gear unit should be appropriately designed to handle the full braking torque of both brakes!

⚠ To prevent damage to the theater brake, an optional microswitch (MIK) is recommended ⇒  B12.

Electro~Motor.ir

5. Motor Δ circuit: 230V_{AC}
 Alternative Y circuit: 400V_{AC}
 Bridge rectifier: GVE20L
 Supply via the motor terminals: 230V_{AC}
 Brake: 205V_{DC}
 Switch-off: AC

Brake applies very slowly!

6. Motor Δ circuit: 400V_{AC}
 Alternative Y circuit: 400V_{AC}
 Half-wave rectifier: GHE40L
 Supply via the motor terminals: 400V_{AC}
 Brake: 180V_{DC}
 Switch-off: AC

Brake applies very slowly!

7. Motor Δ circuit: 400V_{AC}
 Alternative Y circuit: 400V_{AC}
 Quick-switching rectifier: GPU40L
 Brake: 180V_{DC}
 Separate supply: 400V_{AC}
 Switch-off: DC, internal

Switching variants for rapid release!

Typical for FI operation

8. Motor Δ circuit: 400V_{AC}
 Alternative Y circuit: 400V_{AC}
 Quick-switching rectifier: GPU20L
 Brake: 105V_{DC}
 Separate supply: 230V_{AC}
 Switch-off: DC, internal

Switching variants for rapid release!

Typical for FI operation

Switching variants

9. Motor Δ circuit: 400V_{AC}
 Alternative Y circuit: 400V_{AC}
 Quick-switching rectifier: GPU20L
 Brake: 205V_{DC}
 Separate supply: 230V_{AC}
 Switch-off: DC, internal

Switching variant for rapid application!

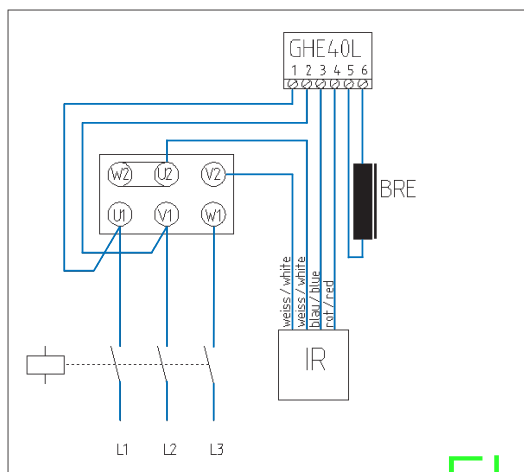

10. Motor Δ circuit: 400V_{AC}
 Half-wave rectifier: GHE40L
 Brake: 180V_{DC}
 Supply via the motor terminals: 400V_{AC}
 Switch-off: DC via current measuring relay

Switching variant for rapid application!

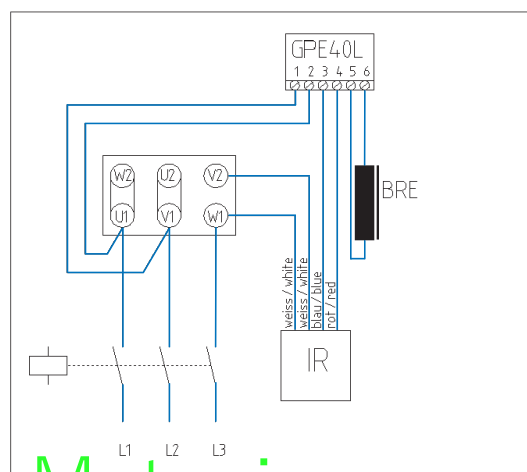

11. Motor Y circuit: 400V_{AC}
 Half-wave rectifier: GHE40L
 Brake: 180V_{DC}
 Supply via the motor terminals: 400V_{AC}
 Switch-off: DC via current measuring relay

Switching variant for rapid application!

12. Motor Δ circuit: 400V_{AC}
 Quick-switching rectifier: GPE40L
 Brake: 180V_{DC}
 Supply via the motor terminals: 400V_{AC}
 Switch-off: DC via current measuring relay

Switching variant for rapid release and application!

Electro~Motor.ir

13. Motor Y circuit: 400V_{AC}
 Quick switching rectifier: GPE40L
 Brake: 180V_{DC}
 Supply via the motor terminals: 400V_{AC}
 Switch-off: DC via current measuring relay
- Switching variants for rapid release and application!

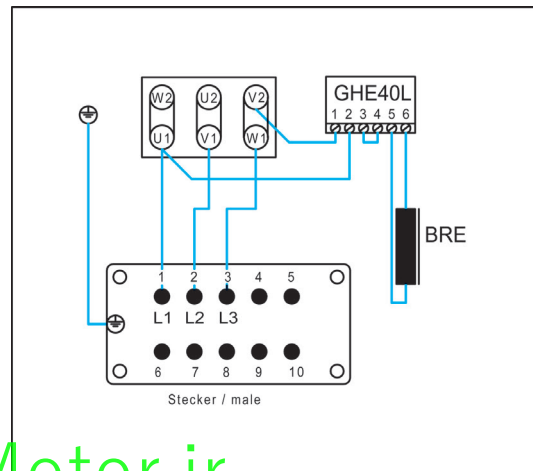

14. Motor Δ circuit: 230V_{AC}
 Bridge rectifier: GVE20L
 Brake: 205V_{DC}
 Supply via the motor terminals: 230V_{AC}
 Switch-off: DC via current measuring relay
- Switching variants for rapid application.
 Not the connection of the current measuring relay to the rectifier!

15. Motor Y circuit: 400V_{AC}
 Bridge rectifier: GVE20L
 Brake: 205V_{DC}
 Supply via the motor terminals: 230V_{AC}
 Switch-off: AC
- Switching variant of connection via motor plug connector (MS)!

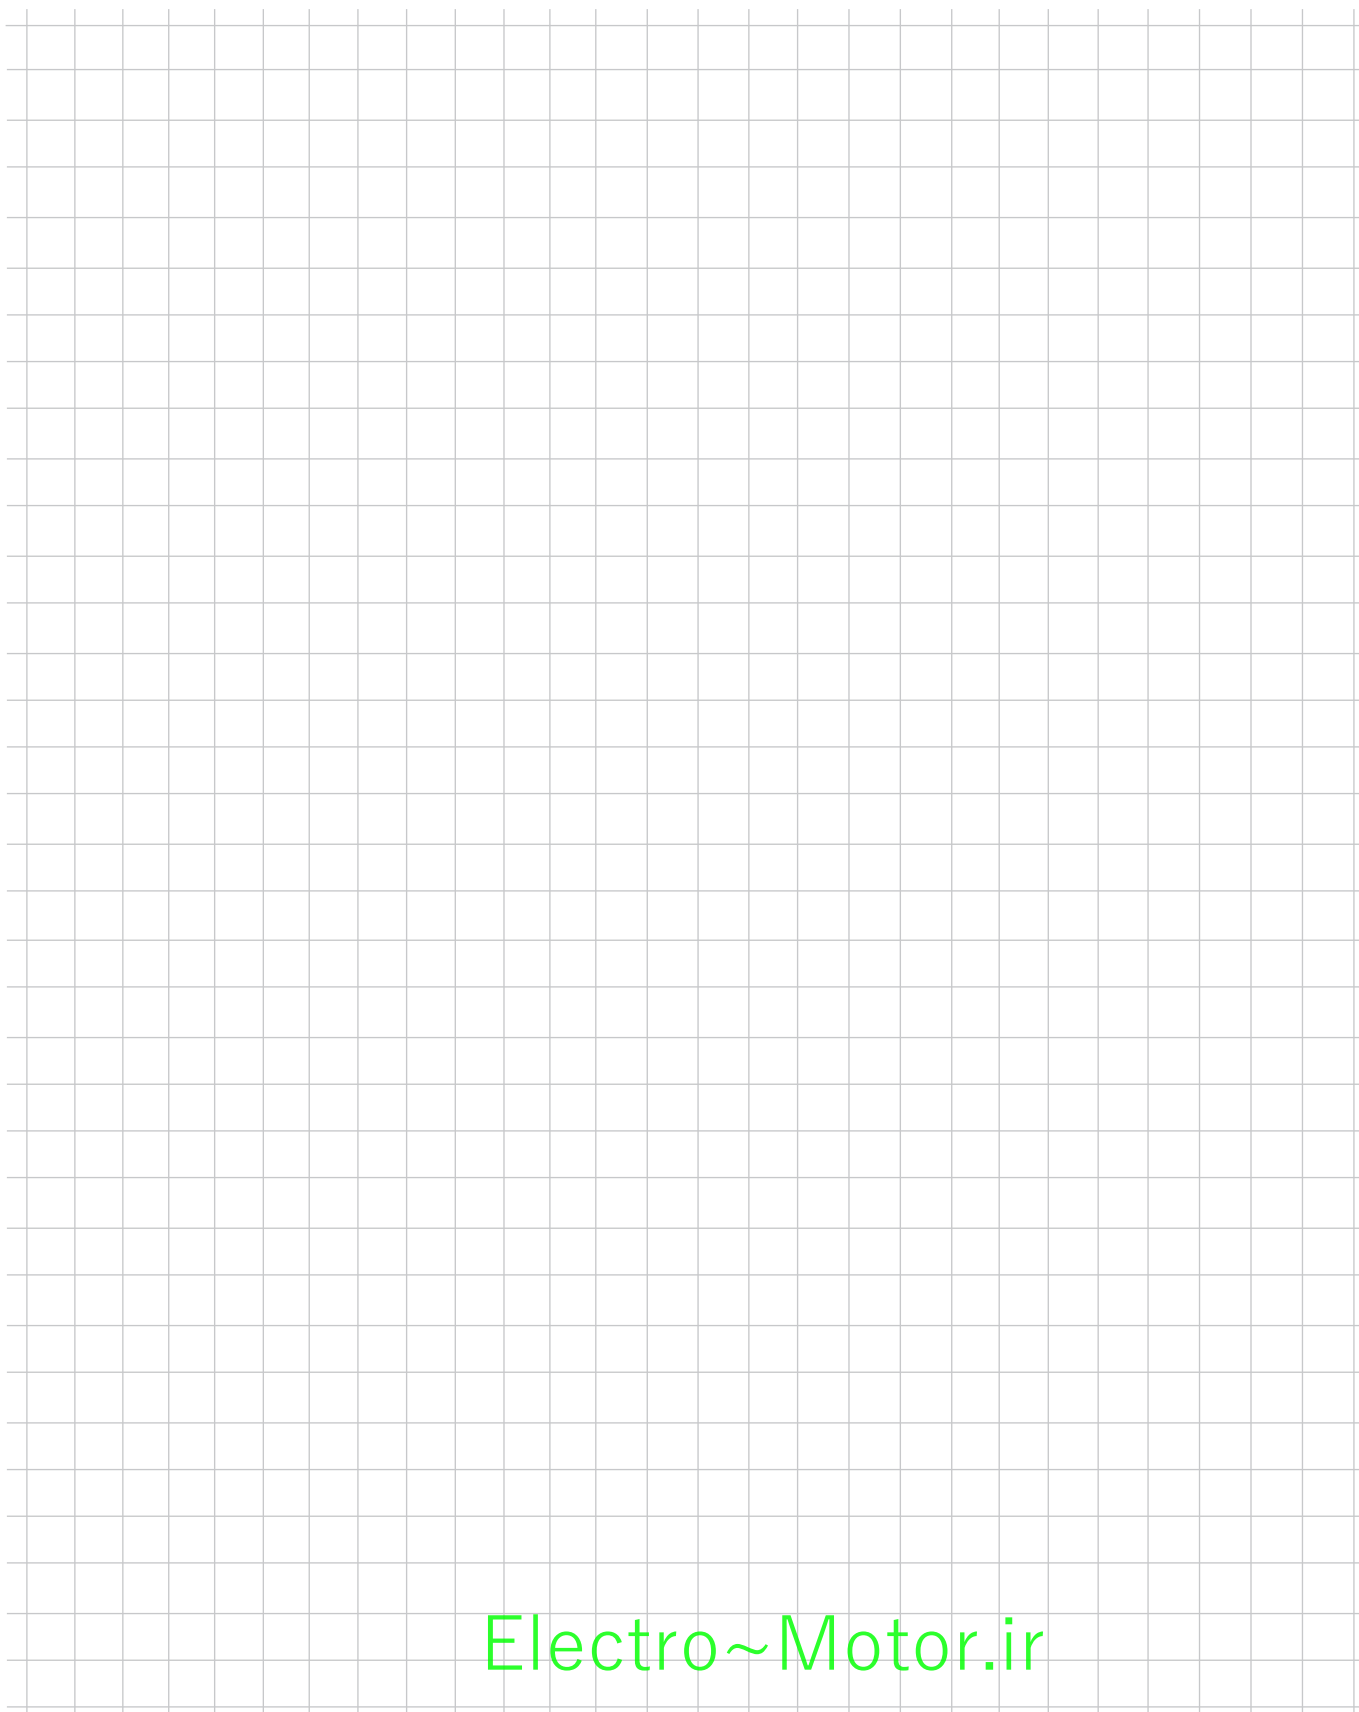

16. Motor Δ circuit: 400V_{AC}
 Half-wave rectifier: GHE40L
 Brake: 180V_{DC}
 Supply via the motor terminals: 400V_{AC}
 Switch-off: AC
- Switching variant of connection via motor plug connector (MS)!
